

# AsherBio

Engineering Cis-Targeted Immunomodulators to  
Enhance Their Selectivity and Effectiveness as  
Therapeutics

**Andy Yeung**  
*Chief Technology officer*

**PEGS- Europe**  
Nov 4th, 2021

- Overview of Asher Biotherapeutics
- Cis-Targeting Technology
- Lead Program AB248: CD8 T cell Targeted IL-2
- Platform of Cis-Targeted Fusions

- A **preclinical-stage immunotherapy company** located in South San Francisco, CA
  - Founded in 2019 by Ivana Djuretic, Andy Yeung, Bob Schreiber (Wash U) and Ton Schumacher (NKI)
  - Experienced management team led by Craig Gibbs, CEO (formerly Forty Seven & Gilead)
  - Strong expertise in immunology, protein engineering, preclinical and clinical development
  - Advised by world renowned SAB members: Bob Schreiber, Ton Schumacher, Miriam Merad (Mount Sinai), George Georgiou (U. of Texas) & Mario Sznol (Yale)
- Advancing **cis-targeting platform** yields immunotherapies that specifically activate selected immune cell subsets
- Building a **broad pipeline of novel cis-targeted therapies** derived from diverse cytokines and cell-types
  - Applications span oncology, cell therapy, infectious disease, and autoimmune disease
- **Lead program AB248**, a CD8 T cell selective IL-2
  - Potential best-in-class based on direct comparison with a 2<sup>nd</sup> gen “not alpha” IL-2 molecule
  - Projected IND in 2022

# Overview of Technology

AsherBio

Cytokines and other immunotherapies exhibit functional pleiotropy, with heterogeneous activity across different cell types.

RNA expression of cytokine receptors across immune cell types  
(Blueprint database)

When used as therapies, they often induce desired biology and undesired consequences simultaneously, limiting efficacy and driving toxicity

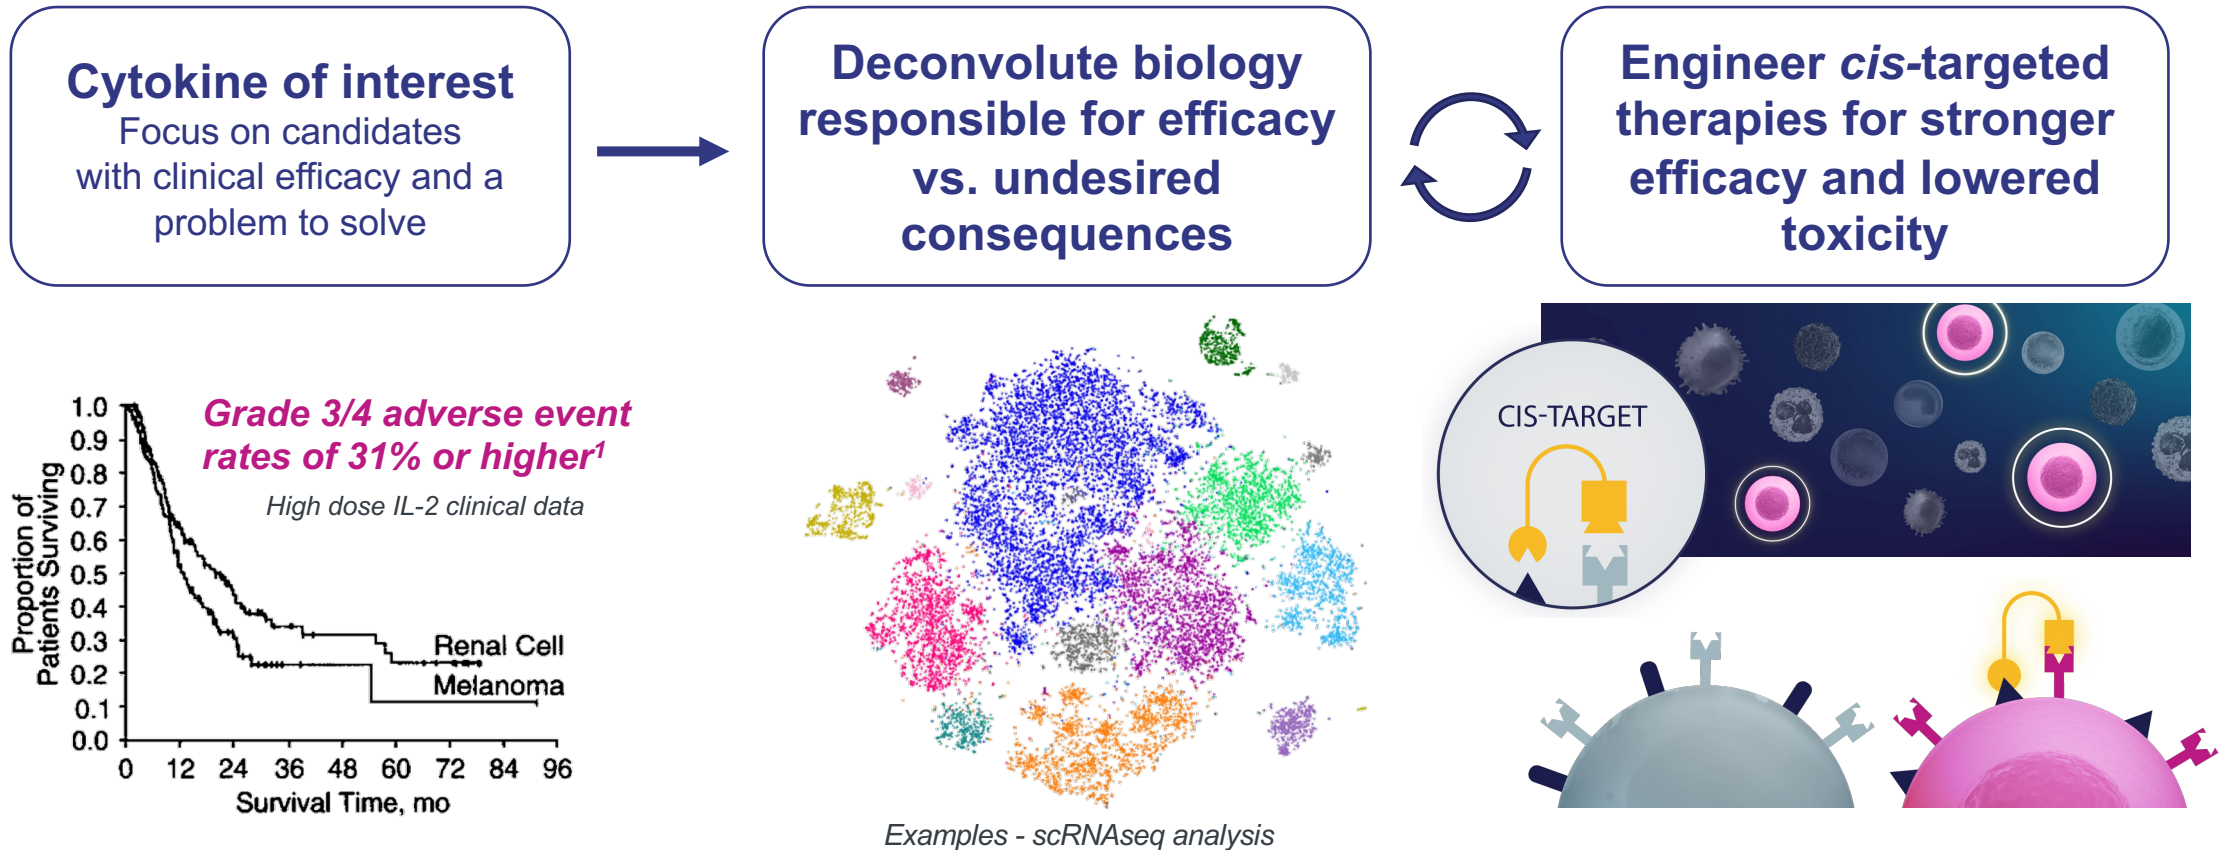

## Current Therapies

## Asher Bio: Targeted Immunomodulation

Asher Bio is solving this problem by creating targeted biotherapeutics precisely directed to desired effector cells. This may mitigate toxicity, pharmacologic sinks, and opposing signaling for **improved efficacy and therapeutic outcomes**.

**Asher Bio aims to maximize the impact of cytokine therapies** by selectively activating desired effector cells and avoiding counterproductive signaling that limits efficacy and reduces therapeutic index

<sup>1</sup>Rosenberg et al., *JAMA*, 1994

# How Does cis-Targeting Work?

## Native cytokine

activates all cell types

## Attenuated cytokine mutein

has weak to no activities on all cell types

## cis-targeted cytokine

only activates the desired cell type

→  
*Optimization of  
interconnected  
properties*

**Molecule with ideal PK/PD,  
Selectivity, Safety, and  
Efficacy Profile**

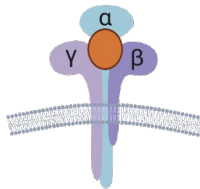

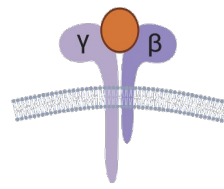

Building an optimal *cis*-targeted molecule is complex, requiring optimization of many properties in parallel to generate a molecule with optimal *in vivo* profile and improved efficacy

# **Lead Program AB248: CD8 T cell targeted-IL2**

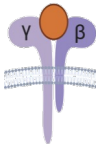

AsherBio

# Overview of IL-2 and “not alpha” IL-2 molecules

Molecule Class	IL-2 <i>and molecules retaining IL2Rα binding</i>		“Not-alpha” IL-2 variants <i>including IL-15 superagonists</i>																					
Receptors	 <i>IL2Rαβγ</i> <table><tr><th colspan="2">IL2Rα Expression</th></tr><tr><td>T cell</td><td>inducible</td></tr><tr><td>Treg</td><td>+++</td></tr><tr><td>NK</td><td>+/-</td></tr><tr><td>ILCs</td><td>+++</td></tr></table>	IL2Rα Expression		T cell	inducible	Treg	+++	NK	+/-	ILCs	+++		 <i>IL2Rβγ</i> <table><tr><th colspan="2">IL2Rβγ Expression</th></tr><tr><td>T cell</td><td>+</td></tr><tr><td>Treg</td><td>+</td></tr><tr><td>NK</td><td>+++</td></tr><tr><td>ILCs</td><td>+</td></tr></table>	IL2Rβγ Expression		T cell	+	Treg	+	NK	+++	ILCs	+	
IL2Rα Expression																								
T cell	inducible																							
Treg	+++																							
NK	+/-																							
ILCs	+++																							
IL2Rβγ Expression																								
T cell	+																							
Treg	+																							
NK	+++																							
ILCs	+																							
Examples	aldesleukin, bempegaldesleukin (NKTR-214), BAY 50-4798		THOR-707, simlukafusp alfa (FAP-IL2v), nemvaleukin alfa (ALKS 4230), N-803 (ALT-803), SOT101																					
Monotherapy Clinical Efficacy	ORR of ~20% with CR rate of 5-10% in RCC and melanoma (high dose aldesleukin)		Sporadic reports of PRs No reported CRs to-date																					
Clinical Toxicities	IL2Rα-dependent toxicity dominates – numerous, but vascular leak syndrome (VLS) most problematic <i>VLS is driven by IL2Rα+ cells</i>		IL2Rβγ-dependent tox unmasked, including liver tox and cytokine release syndrome (CRS) <i>Likely driven by IL2Rβ<sup>high</sup> cells like NK cells</i>																					

Not alpha IL-2s were designed to avoid vascular leak syndrome and Treg activation observed with high dose IL-2 but additional liabilities remain: toxicity and suboptimal efficacy

## 2<sup>nd</sup> Gen. IL-2 “Not α” Agonists (incl. IL-15) Have Suboptimal Profiles

IL-2/15	Company and Drug	Description	In vitro EC50 (pSTAT5, nM)			Clinical Peripheral Cell Expansion (fold change)			Current Phase	Monotherapy activity in solid tumors?
			CD8	Treg	NK	CD8	Treg	NK		
	<b>NEKTAR</b> <i>NKTR-214 Bempeg</i>	PEG IL-2	0.5	0.001	0.3	1.7 - 2.1X	5 - 10X	3.2 - 5X	3	No. 60% ORR in 1L Mel with αPD1.
2 <sup>nd</sup> gen “not α” IL2Rβγ agonists	  <i>THOR-707</i>	PEG IL-2 (site specific)	5.7	2.0	0.6 - 1	3.7-4.5X	1.7-3.5X	7.7-13X	1/2	Yes, one PR
	 <i>FAP-IL2v</i>	anti-FAP antibody IL-2 “not α” fusion	1.6	0.7	0.4	2.7-3.4X	2X	13X	N/A	Yes, 9% ORR
	 <i>ALKS 4230</i>	IL-2 mutein fused to CD25 ECD	1-2	0.59	0.45	2.2X	2.6X	8.4X	2	Yes, 4 melanoma PRs
	 <i>N-803 ALT-803</i>	IL-15 super-agonist Fc fusion	0.03†	Not reported	0.005†	1 - 2X	1-1.3X	8X	2	No
	 <i>SO-C101</i>	IL-15Ra/IL-15 complex	0.02†	Not reported	0.005†	1.5X	Not reported	12X	1	Yes, 1 squamous cell carcinoma PR

- “Not α” IL-2 and IL-15s avoid vascular leak, but clinical activity is suboptimal compared to WT IL-2
- “Not α” IL-2 and IL-15s still activate Tregs, although not as extensively as WT IL-2 and NKTR-214; they also preferentially activate toxicity-inducing NK cells due to their high expression of IL2Rβγ
- **An ideal agent would selectively activate CD8+ T cells *without* activating Treg or NK cells, which may allow for an improved efficacy and safety profile**

### Our solution: AB248\*

†Representative molecules; data from third party (Miyazaki et al., SITC, 2019). # Pharmacodynamic Profile of CD8-IL2 in Cynomolgus Monkeys

Cynomolgus monkey  
*n* = 2 per dosing level

Bleed Dates

- The desired PD profile is seen in cynomolgus monkeys

# Monotherapy in Established MC-38 Colorectal Tumors

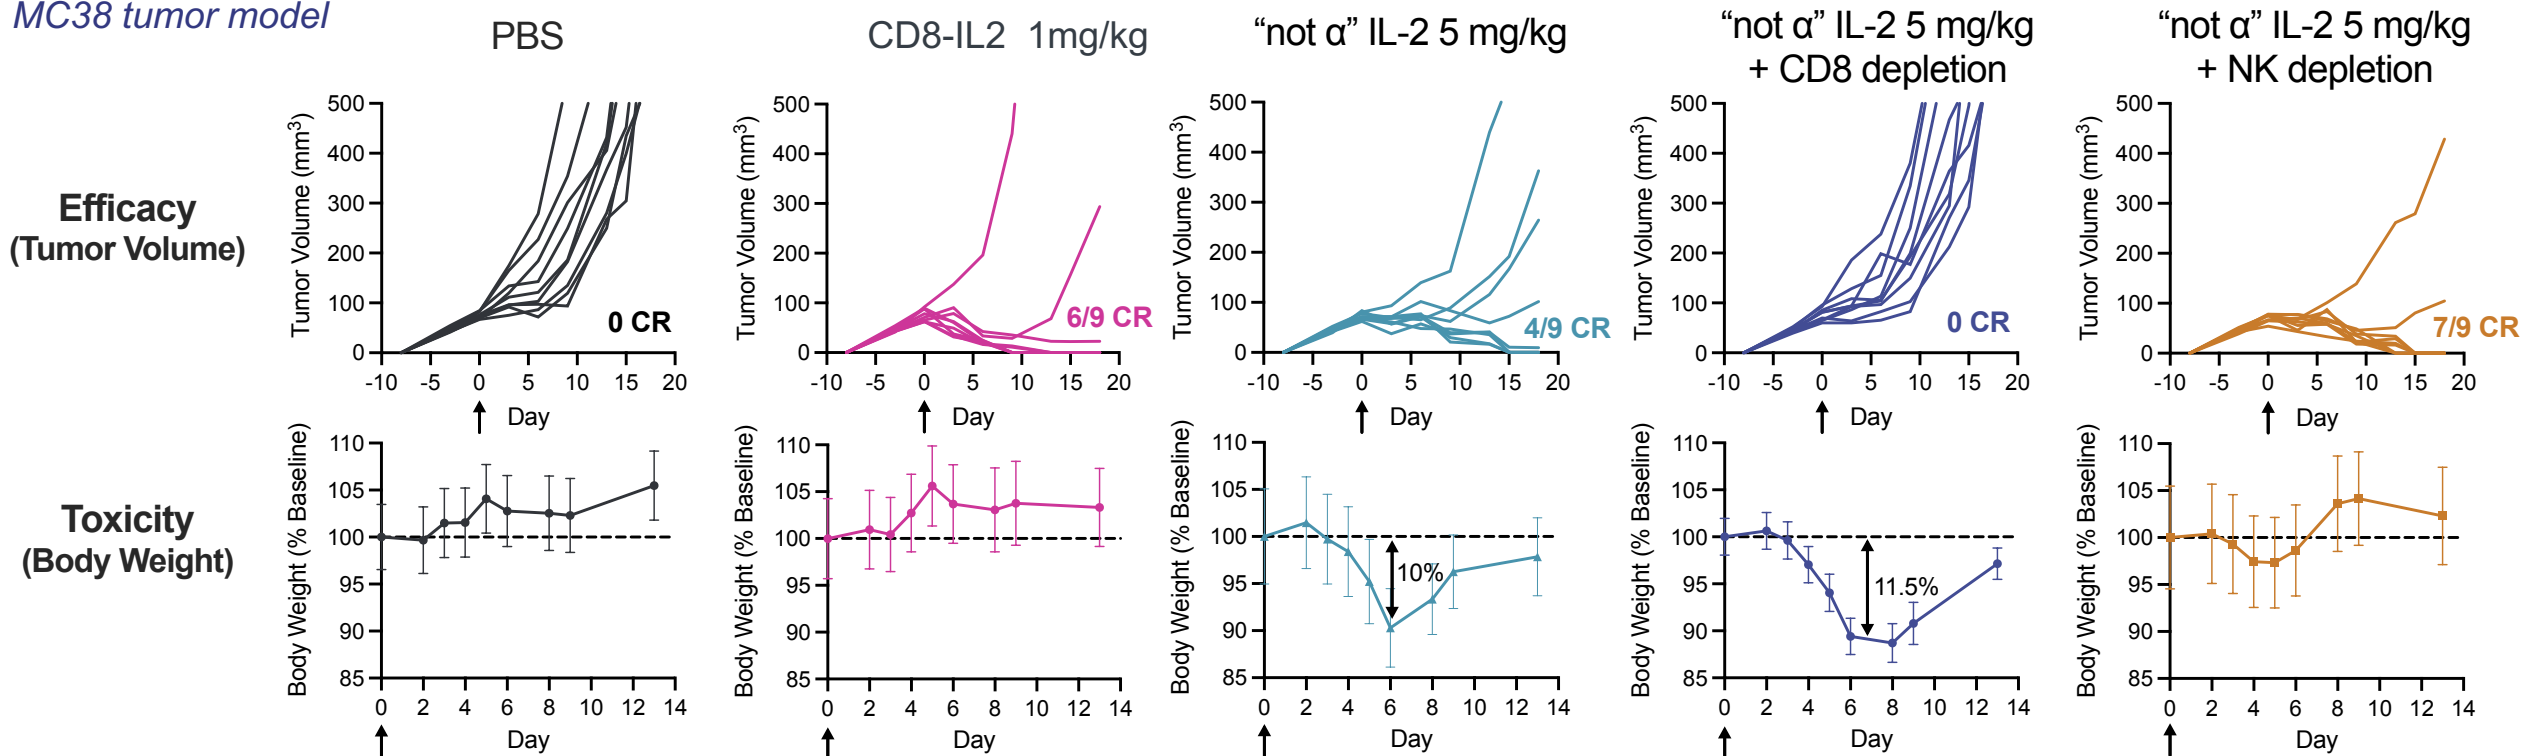

- **Strong monotherapy efficacy** is observed with single dose of CD8-IL2 with **no observed toxicity**
- CD8-IL2 demonstrated superiority over a representative "not α" IL-2

\*CD8-IL2 molar equivalent to "not-α" IL-2

# Efficacy of Untargeted “Not $\alpha$ ” IL-2 is Only Achieved at Toxic Doses; Toxicity is NK Dependent, but Efficacy is CD8 Dependent

## MC38 tumor model

- Anti-tumor efficacy is completely abrogated with CD8 T cell depletion, but body weight loss remains: **CD8 T cells are essential for efficacy but do not contribute directly to toxicity** with “not  $\alpha$ ” IL-2 therapy
- Anti-tumor efficacy is fully retained with NK cell depletion, but body weight loss is abrogated: **NK cells drive toxicity but are dispensable for efficacy** with “not  $\alpha$ ” IL-2 therapy

## Contribution by Peripheral vs Intratumoral CD8+ T cells to anti-tumor response

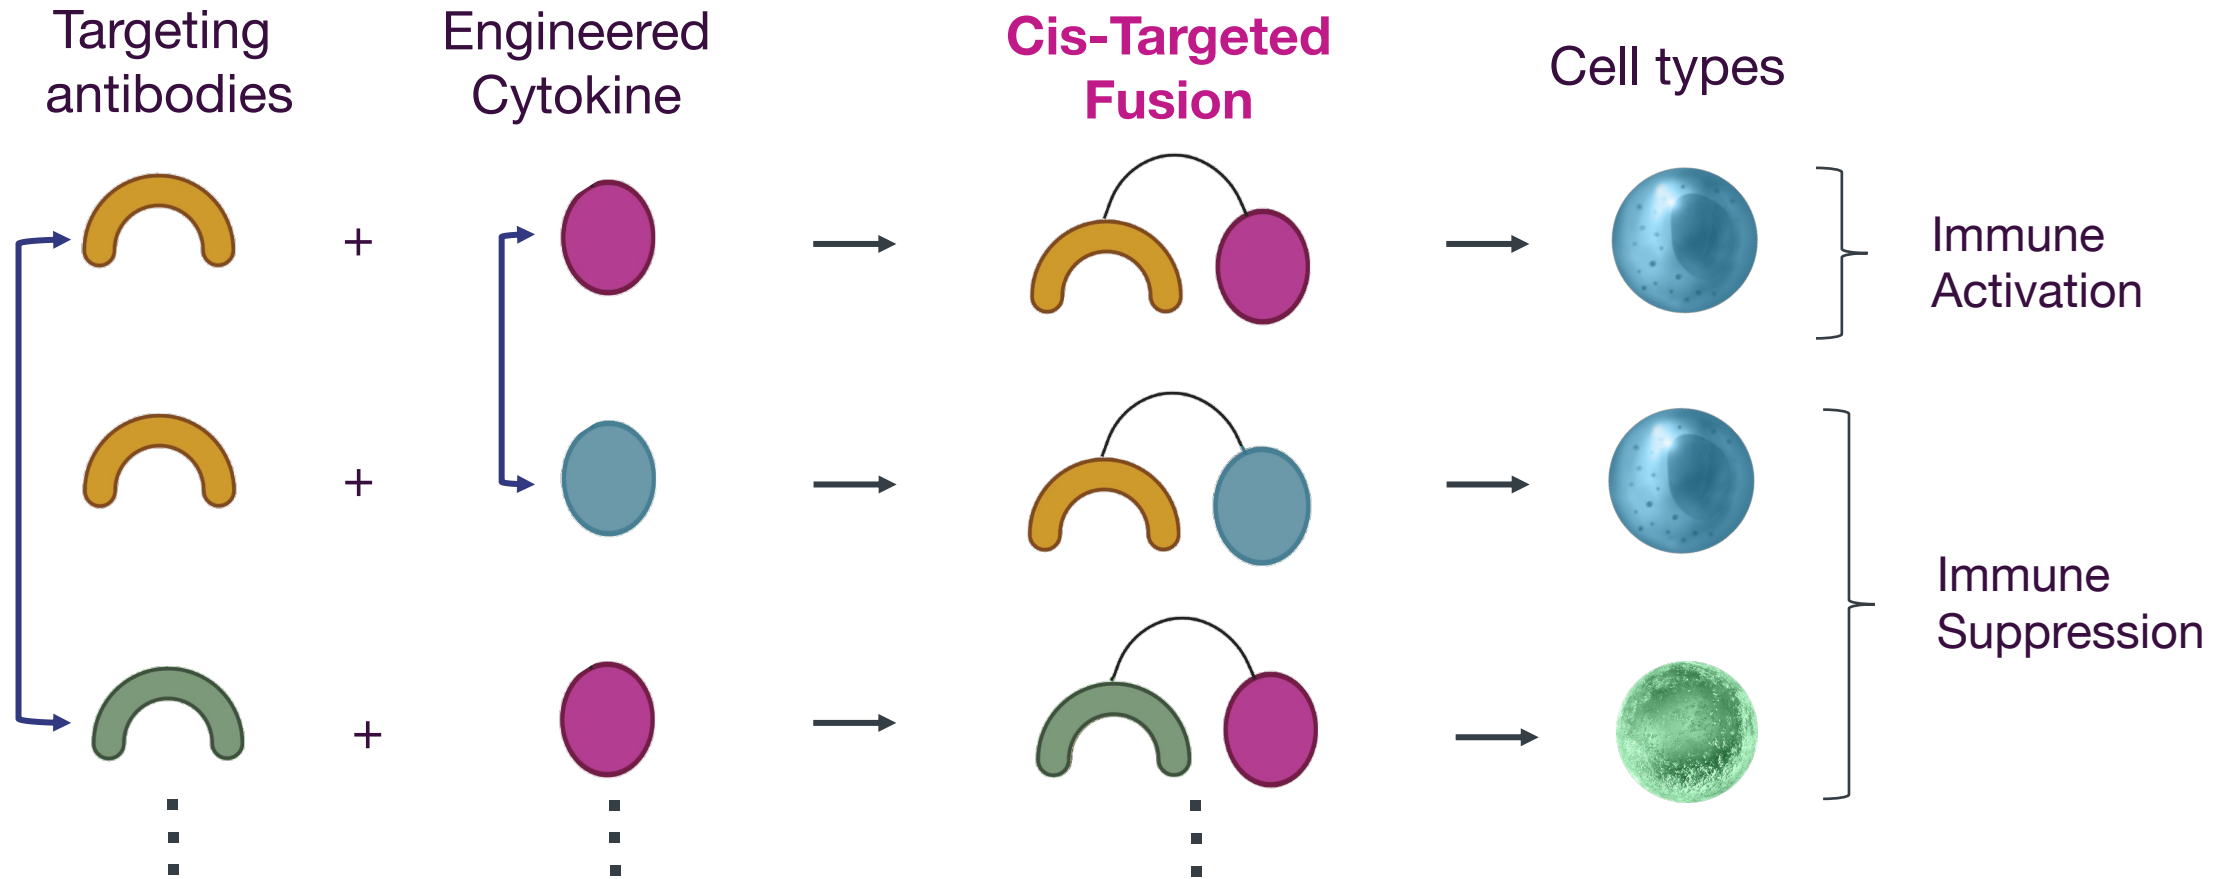

- Treatment with FTY720 shows partial loss of efficacy
- **Both intratumoral and peripheral T cells contribute to efficacy with CD8-IL2.**

# Cis-Targeting Platform

AsherBio

# Modularity of the Platform Enables Rapid Build of a Broad Pipeline of Assets

- Library of targeting arms and engineered cytokines can be readily recombined to generate new molecules for treatments in multiple disease areas

WT

Fusion A  
(Target 1-Cytokine X)

Fusion B  
(Target 1-Cytokine Y)

Fusion C  
(Target 2-Cytokine Z)

CIS-TARGETED FUSION

## Standard approaches

*Undesirable cell types activated, compromising efficacy and driving toxicity*

## cis-targeted therapies

*Steer activity **specifically** to cell types of interest, avoiding counterproductive responses*

**Breakthrough immunotherapies will be enabled by cell-type selectivity**
